INSURETECH AFRICA

Actuarial intelligence for better insurance decisions.

Zimbabwe-first • Built for African insurance markets

FOUNDER | BRADLEY MIZINGA

Early-stage venture • Concept / validation stage

Insurance decisions need better intelligence

Fragmented information

Teams may work across disconnected records, manual processes and inconsistent data.

Risk & pricing complexity

Pricing and underwriting teams need clear assumptions, experience analysis and scenario tools.

Claims investigation pressure

Unusual patterns and duplicate records can be hard to prioritise with limited investigator time.

Limited portfolio visibility

Decision-makers need timely views of claims, premiums, loss ratios and emerging trends.

InsureTech Africa Risk Intelligence

A focused B2B platform combining actuarial methods, analytics and responsible AI.

DATA → ANALYSIS → RISK → INSIGHT → ACTION

Transparent analytics

Show the assumptions, calculations and reasons behind outputs.

Human-led decisions

AI and statistical flags support review; they do not make final claims decisions.

Locally adapted

Designed to fit African insurer workflows, data realities and partner systems.

Three capabilities to prove value first

Keep the MVP narrow; expand only when customer discovery confirms demand.

01 Pricing support

Capture exposure, frequency and severity assumptions. Calculate expected claims costs and explore scenarios with visible formulae.

02 Claims anomaly indicators

Highlight unusual patterns—such as duplicate references or inconsistent values—for human investigation, with clear reasons.

03 Portfolio analytics

Monitor premiums, incurred claims, frequency, severity, loss ratios and trends through management dashboards.

Design principle: An anomaly score is an investigation signal—not proof of fraud.

Start with institutional buyers

Initial geography: Zimbabwe • Expansion path: Southern Africa, then wider African markets.

Insurance companies

Pricing support, claims triage and portfolio monitoring.

Insurance brokers

Workflow support, analytics and integration opportunities.

Specialist providers

Potential later segments: microinsurance and agricultural insurers.

MARKET APPROACH

A bottom-up B2B opportunity

Validate buyer pain, budget ownership, data access and willingness to pay before publishing a market-size claim.

No unsupported TAM figure is presented in this deck; market sizing is a validation task.

Recurring B2B revenue

Technology and analytics supplier to licensed insurance organisations—not an insurer taking underwriting risk.

Software subscriptions	Recurring access fees for insurer and broker teams.
Implementation & integration	Configuration, onboarding and approved system connections.
Analytics services	Scoped analysis and reporting engagements.
API access	Usage-based access for authorised integrations, where appropriate.

Current revenue: USD 0 | Pre-revenue, concept-stage venture

Built around actuarial transparency and local relevance

AI alone is not the advantage; the advantage must be proven through workflow outcomes.

- Zimbabwe-first discovery with insurers and brokers.
- Visible actuarial assumptions, methods and limitations.
- Explainable anomaly indicators that prioritise human review.
- Portfolio reporting designed around practical insurer needs.
- Privacy, security and model governance built into product design.

Competitive landscape

Reference companies to study include Curacel, Pula, Lami and Pineapple; offerings differ by market and product.

Prove one workflow in Zimbabwe

Customer discovery → prototype → controlled pilot → commercialisation.

01 Discover

Interview insurers, brokers, actuaries and claims teams.

02 Scope

Select one costly workflow and define success measures.

03 Prototype

Demonstrate the workflow with synthetic data.

04 Pilot

Test with a willing partner and authorised data.

05 Commercialise

Agree pricing, support, security and procurement.

First proof point: A partner-confirmed problem and measurable pilot outcome—not downloads or vanity metrics.

A disciplined 12-month path

Progress is gated by evidence, data permissions and regulatory review.

- **Months 1–2** — Discovery interviews; choose target workflow; assess data and regulatory requirements.
- **Months 3–4** — Build a narrow MVP with synthetic data: pricing support, anomaly indicators or dashboard.
- **Months 5–6** — Run a controlled pilot with an authorised partner; document results and limitations.
- **Months 7–9** — Improve security, integrations, onboarding and pricing; seek initial contracts.
- **Months 10–12** — Assess additional use cases and regional expansion readiness.

Key risks: regulatory uncertainty • data quality • cyber/privacy • model bias • long enterprise sales cycles

From actuarial insight to practical insurance tools

Founder: Bradley Mizinga | Actuarial Science student

Founder contribution

Concept development, quantitative research, customer discovery and early product planning.

Capabilities to build

Software engineering, data science, insurer operations, cybersecurity and regulatory expertise.

THE NEXT MILESTONE

Secure discovery conversations with Zimbabwean insurers and select one pilot use case.

We are seeking: industry mentors • pilot conversations • technical collaborators • early-stage support

InsureTech Africa | Data → Analysis → Risk → Insight → Action
